# A derivation of the Conjugate Gradient Algorithm

#### Tyler Chen

#### INTRODUCTION

The CG method is well known by minimizing the A-norm of the error over successive Krylov subspaces,  $\mathcal{K}_k(A, b)$ .

This is the second piece in a series on Conjugate Gradient. The previous piece provides an Introduction to Krylov subspace methods.

#### Some definitions

Before we get into the details, let's define some notation and review a few key concepts from linear algebra which we will rely on when deriving the CG algorithm.

- Any inner product  $\langle \cdot, \cdot \rangle$  induces a norm  $\| \cdot \|$  defined by  $\|x\|^2 = \langle x, x \rangle$ .
- For the rest of this piece we will denote the standard (Euclidian) inner product by  $\langle \cdot, \cdot \rangle$  and the induced norm by  $\| \cdot \|$  or  $\| \cdot \|_2$ .
- A positive definite matrix A naturally induces the inner product  $\langle \cdot, \cdot \rangle_A$  defined by  $\langle x, y \rangle_A = \langle x, Ay \rangle = \langle Ax, y \rangle$ . The associated norm, called the A-nor will be denoted by  $\langle \cdot, \cdot \rangle_A$  and is defined by,

$$||x||_A^2 = \langle x, x \rangle_A = \langle x, Ax \rangle = ||A^{1/2}x||$$

- The point in a subspace V nearest to a point x is the projection of x onto V (where projection is done with the inner product and distance is measured with the induced norm.) Given an orthonormal basis for V, this amounts to summing the projection of x onto each of the basis vectors.
- The k-th Krylov subspace generated by A and b is,

$$\mathcal{K}_k(A,b) = \operatorname{span}\{b, Ab, \dots, A^{k-1}b\}$$

### Minimizing the error

Now that we have that out of the way, let's begin our derivation. As stated above, we will minimize the A-norm of the error over sucessive Krylov subspaces

generated by A and b. That is to say  $x_k$  will be the point so that,

$$||x_k - x^*||_A = \min_{x \in \mathcal{K}_k(A,b)} ||x - x^*||_A, \quad x^* = A^{-1}b$$

Since we are minimizing with respect to the A-norm, it will be useful to have an A-orthonormal basis for  $\mathcal{K}_k(A,b)$ . That is, a basis which is orthonormal in the A-inner product. For now, let's just say we have such a basis,  $\{p_0, p_1, \ldots, p_{k-1}\}$ . Since  $x_k \in \mathcal{K}_k(A,b)$  we can write  $x_k$  in terms of this basis,

$$x_k = a_0 p_0 + a_1 p_1 + \dots + a_{k-1} p_{k-1}$$

For convenience define  $x_0 = 0$  and define  $e_k = x^* - x_k$ . Then,

$$e_k = e_0 - a_0 p_1 - a_1 p_1 - \dots - a_{k-1} p_{k-1}$$

Since the coefficients for  $x_k$  were chosen to minimize the A-norm of the error,  $||e_k||_A$ , over  $\mathcal{K}_k(A,b)$ , we know that  $e_k$  has zero component in each of the directions  $\{p_0, p_1, \ldots, p_{k-1}\}$ . In particular, that means that  $a_j p_j$  cancels exactly with  $e_0$  in the direction of  $p_j$ .

We now observe that since the coefficients  $a'_0, a'_1, \ldots, a'_{k-2}$  of  $x_{k-1}$  were chosen in exactly the same way, so that  $a_0 = a'_0, a_1 = a'_1, \ldots, a_{k-2} = a'_{k-2}$ . Therefore,

$$x_k = x_{k-1} + a_{k-1}p_{k-1}$$

and

$$e_k = e_{k-1} - a_{k-1} p_{k-1}$$

Now that we have explicitly written  $x_k$  in terms of an update to  $x_{k-1}$  this is starting to look like an iterative method!

Let's compute an explicit representation of the coefficient  $a_{k-1}$ . As previously noted, we have chosen  $x_k$  to minimize  $||e_k||_A$  over  $\mathcal{K}_k(A,b)$ . Therefore, the component of  $e_k$  in each of the directions  $p_0, p_1, \ldots, p_{k-1}$  must be zero. That is,  $\langle e_k, p_j \rangle = 0$  for all  $i = 0, 1, \ldots, k-1$ .

$$0 = \langle e_k, p_{k-1} \rangle_A = \langle e_{k-1}, p_{k-1} \rangle - a_{k-1} \langle p_{k-1}, p_{k-1} \rangle_A$$

Thus

$$a_{k-1} = \frac{\langle e_{k-1}, p_{k-1} \rangle_A}{\langle p_{k-1}, p_{k-1} \rangle_A}$$

This expression might look like a bit of a roadbock, since if we knew the initial error  $e_0 = x^* - 0$  then we would know the solution to the original system! However, we have been working with the A-inner product so we can write,

$$Ae_{k-1} = A(x^* - x_{k-1}) = b - Ax_{k-1} = r_{k-1}$$

Therefore, we can compute  $a_{k-1}$  as,

$$a_{k-1} = \frac{\langle r_{k-1}, p_{k-1} \rangle}{\langle p_{k-1}, Ap_{k-1} \rangle}$$

## Finding the Search Directions

At this point we are almost done. The last thing to do is understand how to update  $p_k$ . The first thing we might try would be to do something like Gram-Schmidt on  $\{b, Ab, A^2b, \ldots\}$  to get the  $p_k$ , i.e. Arnoldi iteration in the inner product induced by A. This will work fine if you take some care with the exact implementation. However, since A is symmetric we might hope to be able to use some short recurrence, which turns out to be the case.

Since  $r_k = b - Ax_k$  and  $x_k \in \mathcal{K}_k(A, b)$ , then  $r_k \in \mathcal{K}_{k+1}(A, b)$ . Thus, we can obtain  $p_k$  by A-orthogonalizing  $r_k$  against  $\{p_0, p_1, \ldots, p_{k-1}\}$ .

Recall that  $e_k$  is A-orthogonal to  $\mathcal{K}_k(A, b)$ . That is,

$$\langle e_k, A^j b \rangle_A = 0, \quad j = 0, 1, \dots, k - 1$$

Therefore, noting that  $Ae_k = r_k$ ,

$$\langle r_k, A^j b \rangle_A = 0, \quad j = 0, 1, \dots, k - 2$$

That is,  $r_k$  is A-orthogonal to  $\mathcal{K}_{k-1}(A,b)$ . In particular, this means that,

$$\langle r_k, p_j \rangle_A = 0, \quad j = 0, 1, \dots, k-2$$

That means that to obtain  $p_k$  we really only need to A-orthogonalize  $r_k$  against  $p_{k-1}$ ! That is,

$$p_k = r_k + b_k p_{k-1}, \quad b_k = -\frac{\langle r_k, p_{k-1} \rangle_A}{\langle p_{k-1}, p_{k-1} \rangle_A}$$

The immediate consequence is that we do not need to save the entire basis  $\{p_0, p_1, \dots, p_{k-1}\}$ , but instead can just keep  $x_k, r_k$ , and  $p_{k-1}$ . **expand on this!**!

#### Putting it all together

We are now essentially done! In practice, people generally use the following equivalent formulas for  $a_{k-1}$  and  $b_k$ ,

$$a_{k-1} = \frac{\langle r_{k-1}, r_{k-1} \rangle}{\langle p_{k-1}, Ap_{k-1} \rangle}, \quad b_k = \frac{\langle r_k, r_k \rangle}{\langle r_{k-1}, r_{k-1} \rangle}$$

We can now put everything together and implement it in numpy. Note that we use f for the right hand side vector to avoid conflict with the coefficient b.

```
import numpy as np

def cg(A,f,max_iter):
    x = np.zeros(len(f)); r = np.copy(f); p = np.copy(r); s=A@p
    nu = r @ r; a = nu/(p@s); b = 0
    for k in range(1,max_iter):
        x += a*p
        r -= a*s

        nu_ = nu
        nu = r@r
        b = nu/nu_

        p = r + b*p
        s = A@p

        a = nu/(p@s)
```

return x
